

## MBG Releases Version 3.7

[New York, July 10, 2002]—MBG, Inc. rolls out the newest versions of its iTAPIN and iCUBE products in July. iTAPIN is MBG's invoice analysis product, and iCUBE is its corporate chargeback system. Both are web-based and designed for the nation's largest organizations. Current users include GE, Ford, International Paper, and MetLife.

One of the most exciting changes is the new Edit Mode which permits screen customization and provides new language capabilities. Administrators and users with proper permissions now have the ability to customize the systems by renaming most labels. This benefits international companies who can now translate labels into virtually any language (including those which require unicode character sets, for example, Chinese, Japanese, and Russian). In addition, many of MBG's customers are large organizations who have developed their own corporate "language". With Edit Mode, organizations can customize the systems to reflect their needs.

MBG values its customers' feedback and has utilized several client suggestions from the most recent Client Conference in the new version. Version 3.7 further encourages feedback with the new Suggestions link which is accessible directly from the products' web interface. Clients click on the link and can submit suggestions that will be sent to MBG's developers. MBG stores these suggestions and considers them for inclusion in future releases.

Version 3.7 of iTAPIN also features a new kind of integration between MBG products. For clients who use both iTAPIN and MBG's Circuit Inventory module of iSAMS, a new report is available which merges information from the two systems. The Circuit Inventory Exceptions Report allows clients to validate vendor invoices (in iTAPIN) against their own internal inventory (in the Circuit Inventory module). MBG plans to further implement these "inter-product" reports in the future to maximize the effectiveness of their products.

MBG will release version 3.7 to its clients in July. Because MBG products are completely web-based, upgrades are quick and seamless. The aforementioned enhancements are only a small portion of the new features of version 3.7.
